So, this was another lesson that I always dreamed about doing. I love the idea of describing a sequence of manipulations that always work out to some cool pattern that you don't see coming. Then, to me, it is fun to see why this pattern always holds by working through the manipulations on a generic variable.

Introduction to Functional Analysis

Functional analysis is, for a large part, linear algebra on a infinite dimensional vector space over the real or complex numbers. Having a good intuition from linear algebra is essential: you'll know what is reasonable to expect when the dimensional infinities can be controlled (by some sort of compactness), and when they cannot be controlled ...

Algebra is just like a puzzle where we start with something like " $x - 2 = 4$ " and we want to end up with something like " $x = 6$ ". But instead of saying "obviously $x=6$ ", use this neat step-by-step approach: Work out what to remove to get " $x = \dots$ " Remove it by doing the opposite (adding is the opposite of subtracting)

From algebra to FP. If you haven't worked with algebra in a while, it may help to see a few algebraic functions as a refresher: $f(x) = x + 1$ $f(x,y) = x + y$
 $f(a,b,c,x) = a * x^2 + b*x + c$. It's easy to write those algebraic equations as pure functions in Scala/FP.
