This partitioning coefficient is well known for most organic chemicals and is the basis for predicting the environmental fate of organic chemicals (see Chapter 4). Chemicals with low values of K OW are readily soluble, whereas those with high values of K OW are described as "hydrophobic" and tend to be associated with particulates.

soil with poor soil structure has a high risk of generating runoff. The risk of runoff is greatest when poor soil structure is near the soil surface. Soil structure deteriorates when structural units are deformed producing a dense single m ass of soil (or large soil units). This occurs when pressure is applied to a wet and soft soil. Poor soil ...
