Design of Low-Voltage CMOS Bandgap Voltage Reference. In this paper, a low-voltage CMOS Bandgap Reference (BGR) with CTAT (Complementary To Absolute Temperature) compensation is presented. The proposed BGR is simpler than the conventional BGR no need for PTAT (Proportional To Absolute Temperature) current and the reduced number of device (16 less BJTs, 8 less resistors, 2 less PMOS and 2 less NMOS).

Subthreshold logic design of inverter Subthreshold CMOS logic operates with the less supply voltage V_{dd} less than the transistors' threshold voltage V_{th} . This is done to make sure that all the transistors are indeed operating in the subthreshold region. Inverter designed in subthreshold CMOS logic with v_{dd} 0.2v, input voltage 1v, loading capacitance 100pF, W/L of pmos 50u/.25u and for nmos 2.5u/.25u .

Design of a low voltage, low drop-out (LDO) voltage cmos regulator. Chaithra T S Ashwini. Abstract-In this paper a low voltage, low drop-out (LDO) voltage regulator design procedure is proposed and implemented using 0.25 micron CMOS process. It discusses a 3 to 5V, 50mA CMOS low drop-out linear voltage regulator with a single compensation capacitor of 1pF. The experimental results show that

This paper will discuss techniques for implementing low supply voltage Opamps using a standard CMOS process. It will begin by presenting some of the more traditional low voltage Opamp design techniques, such as the folded cascode structure. The paper will then present some more recent developments in Opamp design, such as Floating Gate CMOS (FGCMOS) and Bulk driven input stages. 3. Low Voltage Opamp Solutions 3.1.

Design of ultrahigh-speed low-voltage CMOS CML buffers and latches Abstract: A comprehensive study of ultrahigh-speed current-mode logic (CML) buffers along with the design of novel regenerative CML latches will be illustrated. First, a new design procedure to systematically design a chain of tapered CML buffers is proposed.

A new design topology for low-voltage CMOS current feedback amplifiers Abstract: A new topology for designing low-voltage current feedback amplifiers (CFAs) is presented. By employing a second-generation positive current conveyor followed by an operational amplifier in an unconventional manner, the design circumvents the problem of trying to achieve large transimpedance in a low-voltage environment.

This paper presents the design of a high-voltage driver with an adapted level shifter for switching converters. The proposed HV-driver and level shifter are based on stacked standard CMOS, therefore the design is technology independent. The circuit is designed in 65-nm TSMC technology with a nominal voltage of 2.5 V and optimized for arbitrary supply voltages from 2.6 V to 6.0 V.

Thus, the reference voltage of a conventional BGR that exhibits a nominally-zero TC is controlled to be about 1.25V. This limits the range of reference voltage as well as the operational voltage V_{dd} which can not be lowered than 1.25V. Obviously, these limitations are not welcomed in the low-voltage CMOS design.
