Evolving rule-based models: A tool for intelligent adaptation Abstract: An online approach for rule-base evolution by recursive adaptation of rule structure and parameters is described . An integral part of the procedure is to maximise the model transparency by simplifying the fuzzy linguistic descriptions of the input variables.

An approach to identification of evolving fuzzy rule-based (eR) models is proposed. eR models implement a method for the noniterative update of both the rule-base structure and parameters by incremental unsupervised learning. The rule-base evolves by adding more informative rules than those that previously formed the model. In addition, existing rules can be replaced with new rules based on ...

A rule whose patterns are satisfied is said to be activated or instantiated. When there is more than one activated rule in the agenda then the inference engine has to select one rule, based on priority or on other factors, for firing. Rule based expert systems are built using refraction to prevent trivial loops.

Only around 20 percent, however, use specific key performance indicators for model risk, mainly based on model performance and open validation findings on models. All banks have a model governance framework in place, but 60 percent of the group uses it for the main models only (such as internal ratings based or stress testing).

Rule-based machine learning (RBML) is a term in computer science intended to encompass any machine learning method that identifies, learns, or evolves 'rules' to store, manipulate or apply. The defining characteristic of a rule-based machine learner is the identification and utilization of a set of relational rules that collectively represent the knowledge captured by the system.
