Many case studies of specific cities have investigated factors that contribute to urban energy use and greenhouse-gas emissions. The analysis in this study is based on data from 274 cities and three global datasets and provides a typology of urban attributes of energy use. The results highlight that appropriate policies addressing urban climate change

(GWPs) to calculate 'equivalent' carbon dioxide emissions reductions in the climate change context is examined. We find that GWPs are accurate only for short time horizons. Over long time horizons their use implicitly leads to tradeoffs between near-term and long-term climate change. For one of the most policy-relevant cases, comparing reductions in ...

The International Energy Agency (IEA) expects global energy demand to drop by 6 percent this year, global carbon dioxide emissions to fall by 8 percent, and renewable energy to be the only fuel that shows an increase in worldwide electricity production. According to the IEA, the coronavirus pandemic is a once in a century event for energy demand.

IEA Reports on Global Energy Expectations for 2020 - IER

The Global Warming Potential (GWP) was developed to allow comparisons of the global warming impacts of different gases. Specifically, it is a measure of how much energy the emissions of 1 ton of a gas will absorb over a given period of time, relative to the emissions of 1 ton of carbon dioxide (CO₂).
