Hydraulics, branch of science concerned with the practical applications of fluids, primarily liquids, in motion. It is related to fluid mechanics (q.v.), which in large part provides its theoretical foundation. Hydraulics deals with such matters as the flow of liquids in pipes, rivers, and channels and their confinement by dams and tanks.

In hydraulics and pneumatics, hydraulics is liquid and pneumatics is gas. And, the main difference between these two is, Hydraulic systems use liquids like water and oil to transmit power. Where pneumatic systems use air to transmit power. In hydraulics, liquids are relatively incompressible.

7 Main Difference Between Hydraulics and Pneumatics

Fluid mechanics is concerned with the behaviour of liquids and gases at rest and in motion. The proper understanding of mechanics of fluids is important in many branches of engineering: in biomechanics the flow of blood is of interest; ocean currents require a knowledge of fluid mechanics; chemical processing of plants requires a thorough knowledge of fluid mechanics; aeronautical engineers require knowledge flow of air over the aircraft to reduce drag and increase lift; mechanical engineers ...

Fluid mechanics provides the theoretical foundation for hydraulics, which focuses on the applied engineering using the properties of fluids. In its fluid power applications, hydraulics is used for the generation, control, and transmission of power by the use of pressurized liquids.

Hydraulics - Wikipedia

The hydraulic jack is such a hydraulic system. A hydraulic jack is used to lift heavy loads, such as the ones used by auto mechanics to raise an automobile. It consists of an incompressible fluid in a U-tube fitted with a movable piston on each side. One side of the U-tube is narrower than the other.
