Regeneration

It is well known that, a complete in vitro regeneration protocol needs to be established for each explant of each species, and for each culture stage, in terms of nutrient medium, temperature, length, age and importantly, endogenous level of phytohormones. In this study, callus induction frequency occurred in approximately 45-70%

Get Free In Vitro Callus Induction Regeneration And

In biological research and biotechnology callus formation is induced from plant tissue samples (explants) after surface sterilization and plating onto tissue culture medium in vitro (in a closed culture vessel such as a Petri dish).

Callus (cell biology) - Wikipedia

Introduction

Regeneration of plants
by micropropagation of

Get Free In Vitro Callus Induction Regeneration And

In vitro cultures can be achieved from organ primordia existing in shoot tips and axillary bud explants.

Alternatively, plants can be regenerated from unorganized callus tissues derived from different explants by dedifferentiation induced by exogenous growth regulators.
