Remark: Or else one can just apply a numerical method like the Newton Method directly to the original equation. If we just want the answer, many calculators have a "Solve" button that will do the job. Or else one can ask Wolfram Alpha for the answer. There are many other programs that will solve equations numerically to high accuracy.

This method exploited the index law, $\log_{10} xy = \log_{10} x + \log_{10} y$. To perform a division such as $23.14 \div 0.4526$, the logarithms were subtracted. To find, for example, the logarithm to the base 10 of 463.2 was divided by 5 and then the table of anti-logarithms was applied to find the answer. This used the result,

For example: a^3 is a number with an index of 3 and base 'a'. It is called as "a to the power of 3". Quick Tips and Tricks. 1) The laws of indices and surds are to be remembered to solve problems on surds and indices. Laws of Indices. 1) $x^m \times x^n = x^{m+n}$. 2) $(x^m)^n = x^{mn}$. 3) $(xy)^n = x^n y^n$. 4)

Note: To use the logarithm laws, all logarithms must have the same base. These laws together with the definition of a logarithm can be used to simplify and evaluate logarithmic expressions and to solve equations involving logarithms. Examples 1. Solve $\log_2 5 \log_5 2$ using the definition of a logarithm 5^x Therefore $x = 32$ 2. Simplify

Surds (Clever Keeping Maths Simple. Grade 11 Learner's Book Page 15) What is a logarithm? The logarithm (to the base a) of a number x is the exponent y to which the base a must be raised to equal x. There are the following restrictions on a and x: $a > 0$, $a \neq 1$ and $x > 0$. So if $\log_a x = y$ then $a^y = x$. Laws of logarithms $\log(x.y) = \log x + \log y$
