Linear Parameter Varying Control For

Linear parameter-varying systems LPV systems are a very special class of nonlinear systems which appears to be well suited for control of dynamical systems with parameter variations. In general, LPV techniques provide a systematic design procedure for gain-scheduled multivariable controllers.

Linear parameter-varying control - Wikipedia

A linear parameter-varying (LPV) system is a linear state-space model whose dynamics vary as a function of certain time-varying parameters called scheduling parameters. In MATLAB®, an LPV model is represented in a state-space form using coefficients that are parameter dependent. Mathematically, an LPV system is represented as:

This paper presents an adaptive control solution for linear parameter-varying (LPV) systems with unknown input gain and unmatched nonlinear (state and time-dependent) uncertainties based on the L1 adaptive control architecture. Specifically, we introduce new tools for stability and performance analysis leveraging the peak-to-peak gain (PPG) bound of an LPV system that is computed using linear ...

I am trying to prepare dynamic block and I have an issue with linear parameters. I have two linear parameters. Linear parameter L1 with minimum value 0 and max 100. Linear parameter L2 with minimum value 0 and max 100. What I want to do is to have parameter L2 maximum value be equal to current value of L1. So if: L1_current=50 -> L2max=50.
