The main function, `plot_GMM`, is used for plotting output from Gaussian mixture models (GMMs), including both densities and overlaying mixture weight component curves from the fit GMM. The package also include the function, `plot_cut_point`, which plots the cutpoint ( $\mu$ ) from the GMM over a histogram of the distribution with several color options.

The gmm package allows to estimate models using the three GMM methods, the empirical likelihood and the exponential tilting, which belong to the family of GEL methods, and the exponentially tilted empirical likelihood which was proposed by Schennach(2007), Also it oers several options to estimate the covariance matrix of the moment conditions.

I am interested in using some of the additional features in the gmm package in R to estimate GMM in panel data. Specifically, I am interested in first estimating difference GMM and then later on estimating a collapsed version of system GMM with panel data. As a short cut, and as a way to minimize error, instead of hassling with prepping the ...
