C or $y + \cos x = C$. Thus the solution of the partial differential equation is $u(x,y) = f(y + \cos x)$. To verify the solution, we use the chain rule and get $u_x = -\sin x f'(y + \cos x)$ and $u_y = f'(y + \cos x)$. Thus $u_x + \sin x u_y = 0$, as desired.

4 1. The Physical Origins of Partial Differential Equations The initial condition is $u(x,0) = 0$ and the boundary condition is $u(0,t) = n_0$. To solve the equation go to characteristic coordinates $\xi = x - ct$ and $\tau = t$. Then the PDE for $N = N(\xi, \tau)$ is $N_\tau = -r \sqrt{N}$. Separate variables and integrate to get $2 \sqrt{N} = -r\tau + \Phi(\xi)$. Thus $2 \sqrt{n} = -r\tau + \Phi(x - ct)$.

We usually subdivide differential equations into partial differential equations (PDEs) and ordinary differential equations (ODEs). PDEs involve partial derivatives, whereas ODEs only involve derivatives with respect to one variable. Typical ordinary differential equations are given by (a) $u'(t) = u(t)$, (b) $u''(t) = u^2(t)$,

Partial Differential Equations: An Introduction, 2nd ...

In mathematics, a partial differential equation (PDE) is an equation which imposes relations between the various partial derivatives of a multivariable function. The function is often thought of as an "unknown" to be solved for, similarly to how x is thought of as an unknown number, to be solved for, in an algebraic equation like $x^2 - 3x + 2 = 0$.
