It's easy to search Wikibooks by topic, and there are separate sections for recipes and childrens' textbooks. You can download any page as a PDF using a link provided in the left-hand menu, but unfortunately there's no support for other formats. In a non-reversible reaction this would be about the long and short of it, but when a reaction is reversible the products can also react to produce the reactants again. After a time, a reversible reaction in a closed system can reach what we call a 'dynamic equilibrium'.

Reversible Reactions. In reversible reactions, the reactants and products are never fully consumed; they are each constantly reacting and being produced. A reversible reaction can take the following summarized form: $\text{A} + \text{B} \rightleftharpoons \text{C} + \text{D}$ This reversible reaction can be broken into two reactions.

Reversible vs. Irreversible Reactions - Chemistry LibreTexts

At equilibrium, the rate of the forward reaction (CH4 decomposing into C2H2 and H2) is equal to the rate of the reverse reaction (C2H2 and H2 reacting to form CH4). At equilibrium, the concentrations of all substances are not changing. At equilibrium, both the forward and reverse reactions are still occurring.
