Also, a z-score represents a specific location in the distribution, so that there is a certain area that is to the left of that z-score. And that's exactly how we define the percentile associated to a z-score: it is the area (in percentage terms) that is to the left of that z-score. Mathematically, for a given z-score $\{z\}$, we compute

A raw score is based on the number of items that were answered correctly on a test or a subtest. For example, if a subtest has 20 items and the child answered 14 of them correctly, the raw score is 14. This raw score is then converted to a standard score. Standard scores between 85-115 fall within the average range.
