The Science of Bicycle Racing | Capstone Classroom
According to the classic Bicycling Science book by David Gordon Wilson et al: "A racing bicyclist at 32km/h (20mph) could travel more than 574 kilometers per liter (1,350 miles per US gallon) if there were a liquid food with the energy content of gasoline." Whichever way you look at it, bikes are pretty amazing! Where does your energy go?

Bicycle science - how bikes work and the physics behind them

Le Tour de France: The Great Race Aerodynamics play a huge role in the biggest bicycle race in the world, the Tour de France. Covering over 4,000 kilometers in three weeks of daily racing, "The Tour" is an all-out test of riders' speed, strategy, and heart. Cyclists travel mostly in a pack, called the "peloton," which creates a huge draft.

Science of Cycling: How to be an elite cyclist - YouTube
In road bicycle racing, the main (largest) group of tightly packed cyclists in a race is called a peloton where cyclists ride in a long formation with each (but not the first rider) drafting behind the others before them. When cyclists ride fast they form a paceline. Each cyclist, except the first, is drafting behind another one.
